Measured, in

- reporter, four conditions, 9 h and 24 h
- co-culture killing at three doses
- growth curves and carrying capacity
- published tissue oxygen and lactate

Modelling

- is the gate a product of its inputs?
- where else could it switch on?
- what size of lesion can it see?
- what dose does the indication need?
- can the immune response reach further?

Decisions, out

- kept the native lldPRD promoter
- abandoned the de-repressed swap
- 178 µm floor, declared as a limit
- micrometastasis is not a dose problem
- treat early rather than larger

Every input is a measurement this team made or a published value we cite; every output is a decision the project acted on, or a limit it now states.
